

Nearest neighbours and naive Bayes – Lesson overview

In this lesson, we will explore two fundamental algorithms used in classification: **K-nearest neighbours (KNN)** and **naive Bayes classifiers**. By understanding the **inner workings** of these models and their **practical implementations**, we will gain valuable insights into how to effectively use them to classify data.

 Video	 Knowledge questions
 Examples	 Exercise

Learning objectives

- Understand the principles behind training and implementing naive Bayes classifiers.
- Gain insight into the log loss function and its significance in classification metrics.
- Learn how to train and implement k-nearest neighbours for classification tasks.
